QDENGA®
Dengue vaccine 1, 2, 3 e 4 (attenuated)

Presentation
Powder and diluent for solution for injection containing:
- 1 vial with powder, 1 prefilled syringe with 0.5 mL of diluent and 2 needles

SUBCUTANEOUS USE

ADULT AND PEDIATRIC USE FROM 4 TO 60 YEARS OLD

COMPOSITION
After reconstitution, 1 dose (0.5 mL) contains:
- Dengue virus serotype 1 (live, attenuated)*: ≥ 3.3 log10 PFU*/dose
- Dengue virus serotype 2 (live, attenuated)#: ≥ 2.7 log10 PFU*/dose
- Dengue virus serotype 3 (live, attenuated)*: ≥ 4.0 log10 PFU*/dose
- Dengue virus serotype 4 (live, attenuated)*: ≥ 4.5 log10 PFU*/dose

*Produced in Vero cells by recombinant DNA technology. Genes of serotype-specific surface proteins engineered into dengue type 2 backbone. This product contains genetically modified organisms (GMOs).
#Produced in Vero cells by recombinant DNA technology
**PFU = Plaque-forming units

Excipients: trehalose dihydrate, poloxamer, human serum albumin, potassium dihydrogen phosphate, disodium hydrogen phosphate, potassium chloride and sodium chloride.
Diluent: sodium chloride and water for injections.

1. INDICATION
Qdenga is indicated for the prevention of dengue disease in individuals from 4 to 60 years of age.

2. CLINICAL EFFICACY
The clinical efficacy of Qdenga was assessed in study DEN-301, a pivotal Phase 3, double-blind, randomized, placebo-controlled study conducted across 5 countries in Latin America (Brazil, Colombia, Dominican Republic, Nicaragua, Panama) and 3 countries in Asia (Sri Lanka, Thailand, the Philippines). A total of 20,099 children aged between 4 and 16 years were randomized (2:1 ratio) to receive Qdenga or placebo, regardless of previous dengue infection. Efficacy was assessed using active surveillance across the entire study duration. Any subject with febrile illness (defined as fever ≥38°C on any 2 of 3 consecutive days) was required to visit the study site for dengue fever evaluation by the investigator. Subjects/guardians were reminded of this requirement at least weekly to maximize the detection of all symptomatic virologically confirmed dengue (VCD) cases. Febrile episodes were confirmed by a validated, quantitative dengue RT-PCR to detect specific dengue serotypes.

Clinical efficacy data for subjects 4 to 16 years of age
The Vaccine Efficacy (VE) results, according to the primary endpoint (VCD fever occurring from 30 days to 12 months after the second vaccination) are shown in Table 1. The mean age of the per protocol trial population was 9.6 years (standard deviation of 3.5 years) with 12.7% subjects in the 4-5 years, 55.2% in the 6-11 years and 32.1% in the 12-16 years age-groups. Of these, 46.5% were in Asia and 53.5% were in Latin America, 49.5% were females and 50.5% were males. The dengue serostatus at baseline (before the first injection) was assessed in all subjects by microneutralisation test (MNT50) to allow Vaccine Efficacy (VE) assessment by baseline serostatus. The baseline dengue seronegativity rate for the overall per protocol population was 27.7%.

Tabela 1: Vaccine efficacy in preventing VCD fever caused by any serotype from 30 days to 12 months post second vaccination in study DEN-301 (Per Protocol Set)
VE results according to the secondary endpoints, preventing hospitalisation due to VCD fever, preventing VCD fever by serostatus, by serotype and preventing severe VCD fever are shown in Table 2. For severe VCD fever, two types of endpoints were considered: clinically severe VCD cases and VCD cases that met the 1997 WHO criteria for Dengue Haemorrhagic Fever (DHF). The criteria used in Trial DEN-301 for the assessment of VCD severity by an independent “Dengue Case severity Adjudication Committee” (DCAC) were based on the WHO 2009 guidelines. The DCAC assessed all cases of hospitalisation due to VCD utilizing predefined criteria which included an assessment of bleeding abnormality, plasma leakage, liver function, renal function, cardiac function, the central nervous system, and shock. In Trial DEN-301 VCD cases meeting the WHO 1997 criteria for DHF were identified using a programmed algorithm, i.e., without applying medical judgment. Broadly, the criteria included presence of fever lasting 2 to 7 days, haemorrhagic tendencies, thrombocytopenia, and evidence of plasma leakage.

**Table 2: Vaccine efficacy in preventing hospitalisation due to VCD fever, VCD fever by dengue serotype, VCD fever by baseline dengue serostatus, and severe forms of dengue from 30 days to 18 months post second vaccination in study DEN-301 (Per Protocol Set)**

CI: confidence interval; n: number of subjects with fever; VCD: virologically confirmed dengue
<sup>a</sup> The primary analysis of efficacy data were based on the Per Protocol Set, which consisted of all randomized subjects who did not have any major protocol violations, including not receiving both doses of the correct assignment of Qdenga or placebo
<sup>b</sup> Number of subjects evaluated

VE: vaccine efficacy; CI: confidence interval; n: number of subjects; VCD: virologically confirmed dengue; DENV: dengue virus serotype
<sup>a</sup> Number of subjects evaluated
<sup>b</sup> Key secondary endpoint
<sup>c</sup> Most of the cases observed were due to DENV-2 (0 cases in Qdenga arm and 46 cases in Placebo arm)
<sup>d</sup> p-value <0.001

Early onset of protection was seen with an exploratory VE of 81.1% (95% CI: 64.1%, 90.0%) against VCD fever caused by all serotypes combined from first vaccination until second vaccination.

**Long term protection**
In study DEN-301, a number of exploratory analyses were conducted to estimate long term protection from first dose up to 4.5 years after the second dose (Table 3).

VE: vaccine efficacy, CI: confidence interval, VCD: virologically confirmed dengue, n: number of subjects, N: number of subjects evaluated, NP: not provided
a Exploratory analyses; the study was neither powered nor designed to demonstrate a difference between the vaccine and the placebo group
b Approximated using a one-sided 95% CI
c VE estimate not provided since fewer than 6 cases, for both TDV and placebo, were observed

Additionally, VE in preventing DHF caused by any serotype was 70.0% (95% CI: 31.5%, 86.9%) and in preventing clinically severe VCD cases caused by any serotype was 70.2% (95% CI: -24.7%, 92.9%).

In year-by-year analysis until four and a half years after the second dose, VE in preventing VCD was shown for all four serotypes in baseline dengue seropositive subjects. In baseline seronegative subjects, VE was shown for DENV-1 and DENV-2, but not suggested for DENV-3 and could not be shown for DENV-4 due to lower incidence of cases (Table 4).

VE: vaccine efficacy, CI: confidence interval, VCD: virologically confirmed dengue, NP: not provided, N: total number of subjects in the per analysis set, a number of subjects evaluated in each year is different.

b Year 1 refers to 11 months starting 30 days after second dose.
c Year 2 refers to 13 to 24 months after second dose.
d Year 3 refers to 25 to 36 months after second dose.
e Year 4 refers to 37 to 48 months after second dose.
f VE estimate not provided since fewer than 6 cases, for both TDV and placebo, were observed.

**Clinical efficacy for subjects from 17 years of age**
No clinical efficacy study has been conducted in subjects from 17-60 years of age. The efficacy of Qdenga in subjects from 17 years of age is inferred from the clinical efficacy in 4 to 16 years of age by bridging of immunogenicity data (see below).

**Immunogenicity**
In the absence of correlates of protection for Dengue, the clinical relevance of immunogenicity data remains to be fully understood.

**Immunogenicity data for subjects 4 to 16 years of age in endemic areas**
The GMTs by baseline dengue serostatus in subjects 4 to 16 years of age in study DEN-301 are shown in Table 5.

N: number of subjects evaluated; DENV: Dengue virus; GMT: Geometric Mean Titre; CI: confidence interval; NE: not estimated
* Pooled data from Dengue tetravalent vaccine Lots 1, 2 and 3
** All subjects had GMT values below LLOD (10), hence were reported as 5 with no CI values

The bridging of efficacy is based on immunogenicity data and results from a non-inferiority analysis, comparing post-vaccination GMTs in the baseline dengue seronegative populations of DEN-301 and DEN-304 (Table 7). Protection against dengue disease is expected in adults although the actual magnitude of efficacy relative to that observed in children and adolescents is unknown.

### Table 7: GMT ratios between baseline dengue seronegative subjects in studies DEN-301 (4-16 years) and DEN-304 (18-60 years) (Per Protocol Set for Immunogenicity)

*Non-inferiority: upper bound of the 95% CI less than 2.0.

### Long-term persistence of antibodies

The long-term persistence of neutralising antibodies was shown in study DEN-301, with titres remaining well above the pre-vaccination levels for all four serotypes, up to 51 months after the first dose.

### References

3. PHARMACOLOGICAL PROPERTIES
Pharmacotherapeutic group: Vaccines, Viral vaccines
ATC code: J07BX04

Pharmacodynamic properties
Mecanism of action: Qdenga contains live attenuated dengue viruses. The primary mechanism of action of Qdenga is to replicate locally and elicit humoral and cellular immune responses against the four dengue virus serotypes.

Pharmacokinetic properties
No pharmacokinetic studies have been performed with Qdenga.

Preclinical safety data: Non-clinical safety data revealed no special hazard for humans based on conventional studies of single dose, local tolerance, repeated dose toxicity, and toxicity to reproduction and development. In a distribution and shedding study, there was no shedding of Qdenga RNA in faeces and urine, confirming a low risk for vaccine shedding to the environment or transmission from vaccinees. A neurovirulence study shows that Qdenga is not neurotoxic.

Although no relevant hazard was identified, the relevance of the reproductive toxicity studies is limited, since rabbits are not permissive for dengue virus infection.

4. CONTRAINDICATIONS
QDENGA is not indicated in cases of:

- Hypersensitivity to the active substances or to any of the excipients listed in section COMPOSITION or hypersensitivity to a previous dose of Qdenga.
- Individuals with congenital or acquired immune deficiency, including immunosuppressive therapies such as chemotherapy or high doses of systemic corticosteroids (e.g. 20 mg/day or 2 mg/kg body weight/day of prednisone for 2 weeks or more) within 4 weeks prior to vaccination, as with other live attenuated vaccines.
- Individuals with symptomatic HIV infection or with asymptomatic HIV infection when accompanied by evidence of impaired immune function.
- Pregnant women. (see section 5. SPECIAL WARNINGS AND PRECATIOUS)
- Breast-feeding women. (see section 5. SPECIAL WARNINGS AND PRECATIOUS)

Risk category C in pregnancy. This medicine should not be used by pregnant women. This medicine is contraindicated for women who are breastfeeding.

5. SPECIAL WARNINGS AND PRECAUTIONS FOR USE
Anaphylaxis
As with all injectable vaccines, appropriate medical treatment and supervision must always be readily available in the event of a rare anaphylactic reaction following administration of the vaccine.
Review of medical history
Vaccination should be preceded by a review of the individual’s medical history (especially with regard to previous vaccination and possible hypersensitivity reactions which occurred after vaccination).

Concurrent illness
Vaccination with Qdenga should be postponed in subjects suffering from an acute severe febrile illness. The presence of a minor infection, such as a cold, should not result in a deferral of vaccination.

Limitations of vaccine effectiveness
A protective immune response with Qdenga may not be elicited in all vaccinees against all serotypes of dengue virus and may decline over time (see section 3. PHARMACOLOGICAL PROPERTIES). It is currently unknown whether a lack of protection could result in an increased severity of dengue. It is recommended to continue personal protection measures against mosquito bites after vaccination. Individuals should seek medical care if they develop dengue symptoms or dengue warning signs.

There are no data on the use of Qdenga in subjects above 60 years of age and limited data in patients with chronic medical conditions.

Anxiety-related reactions
Anxiety-related reactions, including vasovagal reactions (syncope), hyperventilation or stress-related reactions may occur in association with vaccination as a psychogenic response to the needle injection. It is important that precautions are in place to avoid injury from fainting.

Women of childbearing potential
As with other live attenuated vaccines, women of childbearing potential should avoid pregnancy for at least one month following vaccination.

Other
QDENGA must not be administered by intravascular, intradermal or intramuscular injection.

Excipients
Qdenga contains less than 1 mmol sodium (23 mg) per dose 0.5 mL, that is to say essentially ‘sodium-free”.
QDENGA contains less than 1 mmol potassium (39 mg) per dose 0.5 mL, that is to say essentially ‘potassium-free”.

Fertility, pregnancy and lactation:

- Women of childbearing potential
Women of childbearing potential should avoid pregnancy for at least one month following vaccination. Women who intend to become pregnant should be advised to delay vaccination

- Pregnancy
Animal studies are insufficient with respect to reproductive toxicity (see section 2. EFFICACY RESULTS). There is limited amount of data from the use of Qdenga in pregnant women. These data are not sufficient to conclude on the absence of potential effects of Qdenga on pregnancy, embryo-foetal development, parturition and post-natal development. Qdenga is a live attenuated vaccine, therefore Qdenga is contraindicated during pregnancy (see section 4. CONTRAINDICATIONS).
Risk category C in pregnancy. This medicine should not be used by pregnant women.

- Breast-feeding
It is unknown whether Qdenga is excreted in human milk. A risk to the newborns/infants cannot be excluded. Qdenga is contraindicated during breast-feeding (see section 4. CONTRAINDICATION).

- Fertility
Animal studies are insufficient with respect to reproductive toxicity (see section 2. EFFICACY RESULTS). No specific studies have been performed on fertility in humans.
Effects on ability to drive and use machines: QDENGA has minor influence on the ability to drive and use machines.

6. MEDICINE INTERACTION
For patients receiving treatment with immunoglobulins or blood products containing immunoglobulins, such as blood or plasma, it is recommended to wait for at least 6 weeks, and preferably for 3 months, following the end of treatment before administering Qdenga, in order to avoid neutralisation of the attenuated viruses contained in the vaccine.
Qdenga should not be administered to subjects receiving immunosuppressive therapies such as chemotherapy or high doses of systemic corticosteroids within 4 weeks prior to vaccination (see section 4. CONTRAINDICATION).

Use with other vaccines
If Qdenga is to be given at the same time as another injectable vaccine, the vaccines should always be administered at different injection sites.

Qdenga may be administered concomitantly with an hepatitis A vaccine. Coadministration has been studied in adults.

Qdenga may be administered concomitantly with a yellow fever vaccine. In a clinical study involving approximately 300 adult subjects who received Qdenga concomitantly with yellow fever 17D vaccine, there was no effect on yellow fever seroprotection rate. Dengue antibody responses were decreased following concomitant administration of Qdenga and yellow fever 17D vaccine. The clinical significance of this finding is unknown.

Incompatibilities
In the absence of compatibility studies, this medicinal product must not be mixed with other vaccine or medicinal products except for the solvent provided.

7. CUIDADOS DE ARMAZENAMENTO DO MEDICAMENTO
Store in a refrigerator (2°C to 8°C). Do not freeze
QDENGA, powder and diluent with shelf life of 18 months from the manufacturing date.
Batch number and manufacturing and expiry dates: see packaging.
Do not use medicine with the expiry date. Store it in its original packaging.
After preparation, the solution reconstituted with the diluent should be used immediately. If this is not possible, Qdenga must be used within 2 hours.
Chemical and physical in-use stability have been demonstrated for 2 hours at room temperature (up to 32.5°C) from the time of reconstitution of the vaccine vial. After this time period, the vaccine must be discarded. Do not return it to the refrigerator.
From a microbiological point of view Qdenga should be used immediately. If not used immediately, in-use storage times and conditions are the responsibility of the user.
QDENGA is a white to off-white powder (compact powder). The solvent is a clear, colourless liquid. After reconstitution, Qdenga is a clear, colourless to pale yellow solution, essentially free of foreign particulates.
Before use, observe the appearance of the medicine.
All medication must be kept out of the reach of children.

8. POSOLOGY AND MODE OF USE
Posology
Individuals from 4 to 60 years of age
QDENGA should be administered through subcutaneous route at a two-dose with intervalo f 3 months (0 e 3 meses), as 0.5mL each dose.
The need for a booster dose has not been established

Paediatric population <4 years of age
The safety and efficacy of Qdenga in children aged less than 4 years has not yet been established.
Currently available data are described in section 2. EFFICACY RESULTS but no recommendation on a posology can be made.

Method of administration
After complete reconstitution of the lyophilised vaccine with the solvent, Qdenga should be administered by subcutaneous injection preferably in the upper arm in the region of deltoid.
Qdenga must not be injected intravascularly, intradermally or intramuscularly. The vaccine should not be mixed in the same syringe with any vaccines or other parenteral medicinal products.

Instructions for reconstitution of the vaccine with solvent presented in pre-filled syringe
Qdenga is a 2-component vaccine that consists of a vial containing lyophilised vaccine and solvent provided in the pre-filled syringe. The lyophilised vaccine must be reconstituted with solvent prior to administration.
Qdenga should not be mixed with other vaccines in the same syringe.

To reconstitute Qdenga, use only the solvent (0.22% sodium chloride solution) in the pre-filled syringe supplied with the vaccine since it is free of preservatives or other anti-viral substances. Contact with preservatives, antiseptics, detergents, and other anti-viral substances is to be avoided since they may inactivate the vaccine.
Remove the vaccine vial and pre-filled syringe solvent from the refrigerator and place at room temperature for approximately 15 minutes.

- Remove the cap from the vaccine vial and clean the surface of stopper on top of the vial using an alcohol wipe.
- Attach a sterile needle to the pre-filled syringe and insert the needle into the vaccine vial. The recommended needle is 23G.
- Direct the flow of the solvent toward the side of the vial while slowly depressing the plunger to reduce the chance of forming bubbles.

- Release your finger from the plunger and, holding the assembly on a flat surface, gently swirl the vial in both directions with the needle syringe assembly attached.
- DO NOT SHAKE. Foam and bubbles may form in the reconstituted product.
- Let the vial and syringe assembly sit for a while until the solution becomes clear. This takes about 30-60 seconds.

Following reconstitution, the resulting solution should be clear, colourless to pale yellow, and essentially free of foreign particulates. Discard the vaccine if particulates are present and/or if it appears discoloured.

- Withdraw the entire volume of the reconstituted Qdenga solution with the same syringe until an air bubble appears in the syringe.
- Remove the needle syringe assembly from the vial. Hold the syringe with the needle pointing upwards, tap the side of the syringe to bring the air bubble to the top, discard the attached needle and replace with a new sterile needle, expel the air bubble until a small drop of the liquid forms at the top of the needle. The recommended needle is 25G 16 mm.
- Qdenga is ready to be administered by subcutaneous injection.

Qdenga should be administered immediately after reconstitution. Chemical and physical in-use stability have been demonstrated for 2 hours at room temperature (up to 32.5°C) from the time of reconstitution of the vaccine vial. After this time period, the vaccine must be discarded. Do not return it to the refrigerator. From a microbiological point of view Qdenga should be used immediately. If not used immediately, in-use storage times and conditions are the responsibility of the user.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

4.8 UNDESIRABLE EFFECTS

Summary of the safety profile
In clinical studies, the most frequently reported reactions in subjects 4 to 60 years of age were injection site pain (50%), headache (35%), myalgia (31%), injection site erythema (27%), malaise (24%), asthenia (20%) and fever (11%).

These adverse reactions usually occurred within 2 days after the injection, were mild to moderate in severity, had a short duration (1 to 3 days) and were less frequent after the second injection of Qdenga than after the first injection.

Vaccine viremia
In clinical study DEN-205, transient vaccine viremia was observed after vaccination with Qdenga in 49% of study participants who had not been infected with dengue before and in 16% of study participants who had been infected with dengue before. Vaccine viremia usually started in the second week after the first injection and had a mean duration of 4
days. Vaccine viremia was associated with transient, mild to moderate symptoms, such as headache, arthralgia, myalgia and rash in some subjects. Vaccine viraemia was rarely detected after the second dose.

Tabulated list of adverse reactions
Adverse reactions associated with Qdenga obtained from clinical studies are tabulated below

The safety profile presented below is based on a pooled analysis including 14,627 study participants aged 4 to 60 years (13,839 children and 788 adults) who have been vaccinated with Qdenga. This included a reactogenicity subset of 3,830 participants (3,042 children and 788 adults).

Adverse reactions are listed according to the following frequency categories:

- Muito comum: ≥1/10
- Comum: ≥1/100 a < 1/10
- Incomum: ≥1/1.000 a < 1/100
- Rara: ≥1/10.000 a < 1/100
- Muito rara: < 1/10.000

</table>

<sup>a</sup> Includes upper respiratory tract infection and viral upper respiratory tract infection

<sup>b</sup> Includes pharyngotonsillitis and tonsillitis

<sup>c</sup> Collected in children below 6 years of age in clinical studies

<sup>d</sup> Includes rash, viral rash, rash maculopapular, rash pruritic

<sup>e</sup> Reported in adults in clinical studies

**Paediatric population**

**Paediatric data in subjects 4 to 17 years of age**

Pooled safety data from clinical trials are available for 13839 children (9210 aged 4 to 11 years and 4629 aged 12 to 17 years). This includes reactogenicity data collected in 3042 children (1865 aged 4 to 11 years and 1177 aged 12 to 17 years).
Frequency, type and severity of adverse reactions in children were largely consistent with those in adults. Adverse reactions reported more commonly in children than in adults were fever (11% versus 3%), upper respiratory tract infection (11% versus 3%), nasopharyngitis (6% versus 0.6%), pharyngotonsillitis (2% versus 0.3%), and influenza like illness (1% versus 0.1%). Adverse reactions reported less commonly in children than adults were injection site erythema (2% versus 27%), nausea (0.03% versus 0.8%) and arthralgia (0.03% versus 1%).

The following reactions were collected in 357 children below 6 years of age vaccinated with Qdenga: decreased appetite (17%), somnolence (13%) and irritability (12%).

**Paediatric data in subjects below 4 years of age, i.e. outside the age indication**

Reactogenicity in subjects below 4 years of age was assessed in 78 subjects who received at least one dose of Qdenga of which 13 subjects received the indicated 2-dose regimen. Reactions reported with very common frequency were irritability (25%), fever (17%), injection site pain (17%) and loss of appetite (15%). Somnolence (8%) and injection site erythema (3%) were reported with common frequency. Injection site swelling was not observed in subjects below 4 years of age.

**Caution:** This product is a new drug and, although research has indicated acceptable efficacy and safety, even if indicated and used correctly, unpredictable or unknown adverse events may occur. In this case, notify the adverse events through the VigiMed System, available on the Anvisa Portal.

10. **OVERDOSE**

No cases of overdose have been reported.

**In case of poisoning, call 0800 722 6001 if you need further guidance.**
